

Accessories Specific to the Screw Connection System

The **RK** accessories programme is carefully thought out and developed with the user in mind. Numerous technical applications can be realized with a minimal expenditure for accessories.

Cross connections Q/QI (Potential distribution)

The screw-on cross connections in the 2.5 to 10 mm² range, are available as insulated (**QI**) and non-insulated (**Q**) models. Due to their angled geometry, the **QIs** can be arranged in a staggered pattern. This allows two potentials to be conducted parallel. A high measure of flexibility is afforded by the construction of the terminal blocks and the variability of the cross connectors.

External Cross Connectors AQ/AQI

For terminal blocks which have a cross connection channel or in applications in which another potential needs to be cross connected, the use of the **AQIs** allows this to be realized.

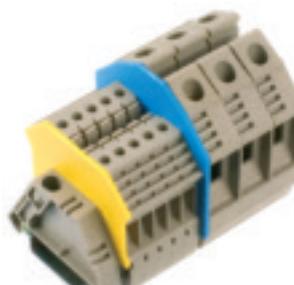

Screw Connection System Colour Variations

Numerous **RK** terminal blocks are available in various standard colour variations.

End Plates / Visual Separation

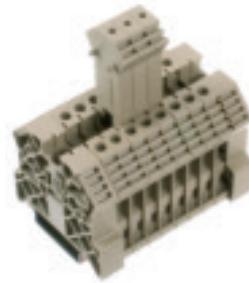

In order to make a transition from a larger to a smaller size terminal block or to switch at the end of a terminal block, an end plate must be installed. In addition, **APs** influence airways and leakage paths. The potentials can be marked visually using the various choice of colours.

Accessories Specific to the Screw Connection System

Testing / Examination

With the test adapters **TA**, which can be attached to any number of poles by means of notched plugs, the examination of cut terminal blocks can be performed quickly and securely. Every spring terminal has a corresponding test pick-up through which the potential conducting contact rail is contacted.

Marking

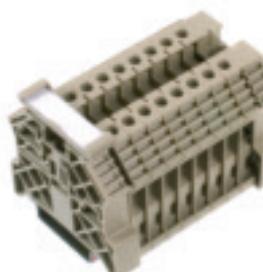

The marking / identification of the screw connection terminal blocks can be carried out using different marking systems.

SB, PMC, BSTR and MC are available with standard print (neutral) or without. A number of group marking carriers are included in the delivery for marking cut terminal blocks.
(see General Accessories chapter on page 164)

Mechanical Attachment

During the manufacture of the terminal blocks, end brackets must be installed on both outer ends as a mechanical fix. For this purpose **CONTA-CLIP** offers a large number of screw-on and click-on end brackets, on which group marking carriers can be attached.

Special Accessories

The VDE regulations require that mains terminals be covered. The yellow **AD1/AD4** covers marked with a bolt of lightning close off the actuating channel and therefore prevents the live clamping point from being activated.

Test Isolation Terminals

Due to the diverse accessories programme for test isolation terminals, various switch variations are possible. The specific accessories are described based on basic switching examples.

Accessories Specific to the Screw Connection System

Cross Connections Q/QI (Potential Distribution)

The screw-on cross connection system **Q/QI** allow a time-saving distribution of potentials through terminal blocks with the same cross-section range. **QI** is safe to contact and is available with 2, 3, 4, and 10 poles, as is the **Q** cross connection system. With the **QI** system, different potentials can be conducted parallel in the 2.5 mm² to 10 mm² cross-section range without the loss of poles.

Contact terminals can generally be skipped by breaking out individual contact elements in the standard contact terminals.

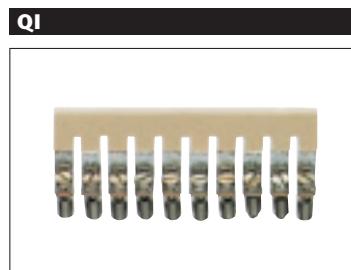

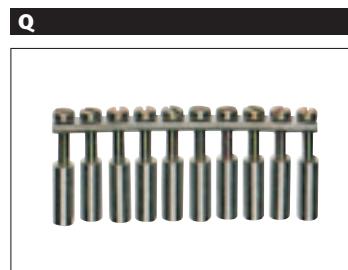

The cross connections can be shortened using a cutting tool, whereby attention must be paid to inserting an end plate on the side which was cut in order to maintain the rated voltage.

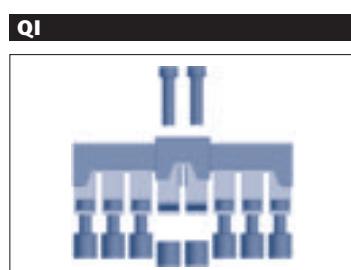

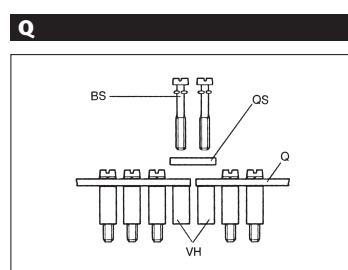

Q/QI Pre-Assembled Cross Connectors

In pre-assembled cross connectors, the cross connection rails, connecting sleeves, and attachment screws corresponding to the number of poles are already pre-assembled so that no parts can be lost. During installation, the pre-assembled cross connectors only have to be inserted in the respective terminal block. The cross connection units are available in 2, 3, 4, and 10 pole models. Depending on the type of terminal block, we will supply the insulated cross connector **QI** and/or the non-insulated cross connector **Q**.

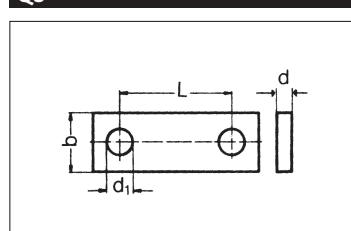

Cross Connections (Q/QI) of a potential through more than 10 terminal blocks. The first or the last attachment screw is screwed out of the **VH** from the cross connection. The **QS 2** or **QI 2** without **VH** are put in the middle and the two attachment screws are screwed back into the **VH**.

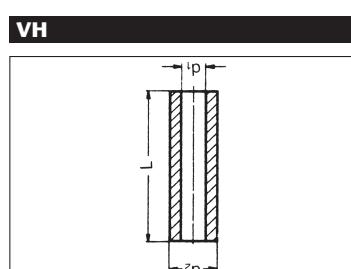

Single Parts Cross Connection Q (QS + VH + BS = Q)

QS cross connection rails In order to cross connect several terminal blocks maintaining the same potential, cross connection rails can be used. The cross connection rails are made of copper or bronze material. The surface is galvanized with nickel. These cross connection rails are supplied in lengths with 2, 3, 4, and 10 poles, in coordination with each terminal width. The cross connection rail is connected electrically to the contact rail of the terminal block by means of a connecting sleeve. For some terminal block types we supply 0.5 m long cross connection rails. This allows the cross connections of as many poles as desired.

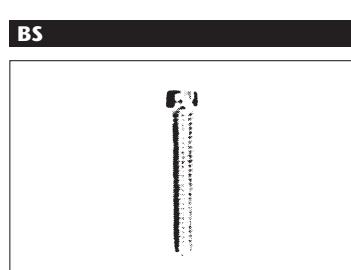

VH Connecting Sleeves

The length of the **VHs** is coordinated with the respective terminal. They are manufactured from copper or bronze materials. The surface is nickel-plated. One **VH** must be used for each terminal to be connected.

BS Fixing screws

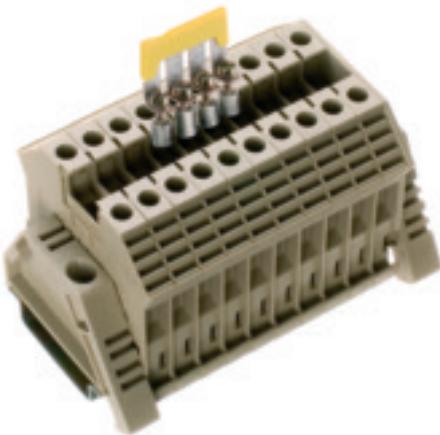

In order to connect the cross connection rail to the contact rail of a terminal block with the sleeve (**VH**), a steel fixing screw is used. The steel screw is for the permanent mechanical connection of the cross connection unit to the contact rail.

Accessories Specific to the Screw Connection System

Cross Connections Q/QI (Potential Distribution)

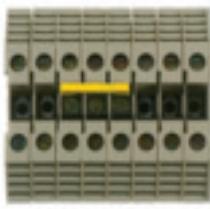

Handling

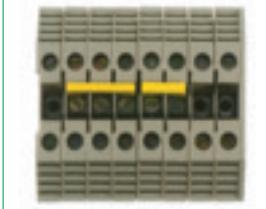

Examples

Variability of the screw-on cross connectors

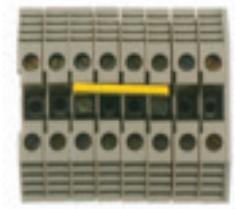

Pre-assembled cross connection units with 2, 3, 4, and 10 poles reduce the installation time considerably. When using insulated cross connectors **QI**, there are more advantages for the terminal blocks up to 10 mm². Due to the angled construction, two **QIs** can be installed in a staggered arrangement. This allows two potentials to be conducted parallel. Since the **QIs** are insulated and, therefore, safe to contact in compliance with VDE 0106 Part 100, no end plates or partitions for adjacent cross connections up to 400 V are needed. The **QI** cross connections can conduct the rated current of the terminal blocks. Skipping of terminals is possible since the individual contact bridges can be broken out of the structure.

Cross Connections ZQI 2,5 (Potential Distribution) for RK 2,5/35N/2Q

In the terminal block **RK 2,5/35N/2Q**, the idea of the plug-in cross connection from the tension spring connection system was transferred to the screw connection system. The plug-in cross connection system **ZQI 2,5** allows a time-saving distribution of potentials, is contact safe and is available with 2 to 10 poles and up to 99 poles. Different potentials can be conducted parallel without the loss of poles. The cross connections can be shortened using a cutting tool. However, attention must be paid that an end plate is inserted on the side which was cut in order to maintain the rated voltage.

Accessories Specific to the Screw Connection System

Cross Connections ZQI 2,5 (Potential Distribution) for RK 2,5/35N/2Q | Colour Variations

Up to 25 terminal blocks can be connected to each other individually with the **ZQI 2.5** cross connectors listed here. Besides its flexibility, this system is distinguished by savings in the assembly time and the associated reduction in costs.

Insulated External Cross Connectors AQI

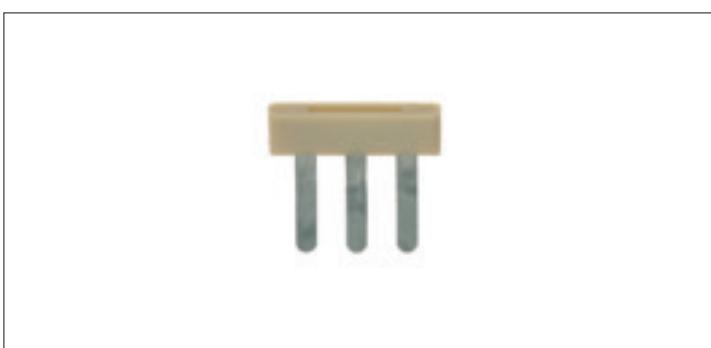

External cross connecting bridges allow the potential to be branched at terminal blocks which have no internal cross connection channel. The **AQI** is an external cross connector coated in polyamide 6.6. When external cross connections are used, the nominal cross-section is reduced to the next smallest conductor.

Accessories Specific to the Screw Connection System

Non-Insulated External Cross Connectors AQ

External cross connecting bridges allow the potential to be branched at terminal blocks which have no internal cross connection channel. The **AQ 58** type is supplied with 58 poles. Contact elements can be broken out easily by hand. The stick-on insulation section **IP** is available for **AQ 58**. When external cross connections are used, the nominal cross-section is reduced to the next smallest conductor.

Bridgeable PEN feed-in blocks

If electronic controls are of the 5-conductor network feed-in design and are connected 4-conductor to an energy supply network, then a conductive connection must be created – from the earth terminal **SL** to the neutral terminal **N**. This is fulfilled by the external cross connector **AQV 2 PEN**.

Accessories Specific to the Screw Connection System

Screw Connection System Colour Variations

The following colour variations are standard colour variations.
On demand and dependent on previously determined batches
individual colour variants are feasible.

Accessories Specific to the Screw Connection System

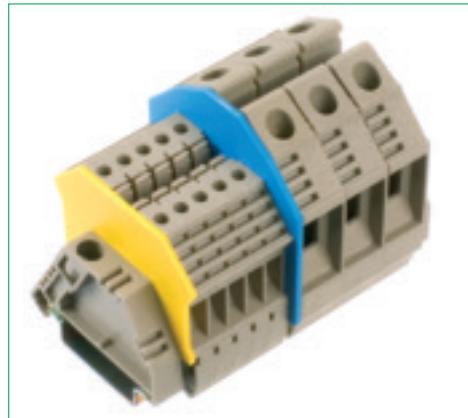

End Plates / Visual Separation

AP end plates are usually inserted at the end of a clamp point. If work is carried out within a terminal block with different / various sized terminal blocks, end plates must also be inserted in order to ensure contact protection and the safety of the fingers. The outer dimensions of the end plates correspond to the dimensions of the terminal blocks.

Coloured end plates are often inserted in order to mark a clear distinction between different power circuits or voltage levels. In addition, the use of end plates lengthens the airways and leakage paths, which in turn influence the rated voltage.

Rapid installation of the end plates is enabled by notched plugs.

Due to the special construction of the **RK** series, no end plates must be inserted for adjacent **QI** cross connectors with different potentials.

End plates for standard terminal blocks SRK/RK/FF/SF/PTK

Accessories Specific to the Screw Connection System

Single and fourfold covers

The VDE regulations require that network connection terminals be covered. The yellow covers marked with a bolt of lightning or the white covers **EA** and **AD** close off the actuating and cross connection channels of the terminal block, thus preventing the activation of the live clamping point.

The **EA 1** and **AD 1** covers are pushed onto the terminal blocks from above until they catch. The white variation can be labelled using the marking pen **BS 1** or the marking system **EMS**.

The **AD 4s**, which are designed with the appropriate cross-section for four terminal blocks, are fixed mechanically by means of two plastic screws. Two variations of overprint [German and English (.../E)] are available.

Single cover EA 1

Cross Connection Channel Covers AD Q

For the RK 2.5-4, RK 6-10, RK 2.5-4 ZRL, FF 2.5 and SF 2.5-4 terminal blocks, 60 mm long covers are available which can be used to protect against contact when using non-insulated cross connectors. The section consists of polamide 6.6 and is supplied in the colours transparent and white.

Accessories Specific to the Screw Connection System

Cover Section AD in combination with the partition TWMF

Several safety regulations, for example "Electrical Systems and Means of Operation" (VBG 4) and VDE 0106 Part 100/3.83, require that contact with the live parts of electrical means of operation must be protected against. In terminal blocks this protection must be provided by additional covers of cross connectors **Q** or test jacks are used. For this purpose there are cover sections with assigned support brackets which can be used on the most important terminal sizes. The support brackets can be arranged at the end of the terminal or dispersed. They can be attached to the mounting rail TS 32 or TS 35.

| TWMF | AD | Type | Cat. no. | Qty. p. pck. | Colour |

Partitions TW

When cross connections are used, partitions must be inserted between the non-insulated cross connectors as a rule. This is required to maintain the necessary airways and leakage paths.

| Partitions TW | Type | Cat. no. | Qty. p. pck. | Colour | For terminal |

Insulation plates TRS

When cross connections are used, insulation plates are used with some types of terminals in order to maintain the necessary airways and leakage paths. Partition chips can be inserted between the cross connectors at a later point in time.

| Insulation plates TRS | Type | Cat. no. | Qty. p. pck. | Colour | For terminal |

Connection Sleeves VBS

Connection sleeves for joining two or three levers of the fuse disconnecting terminals STK 2 and SIK 10 or SIK 10Z and STRD1. The **VBS** plastic sleeves are pushed onto the levers from the side, combining them mechanically into two or three pole units. This allows the simultaneous disconnection from multi-pole power circuits.

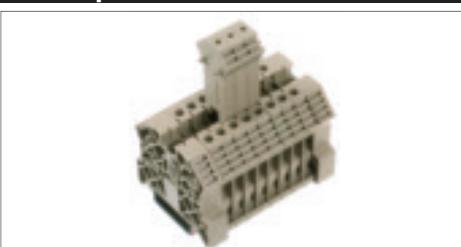

| Connection Sleeves VBS | Type | Cat. no. | Qty. p. pck. | Colour | For terminal |

Testing / Examination

Test adapter TA

With the test adapter **TA**, which can be attached to any number of poles by means of notched plugs, the examination of cut terminal blocks can be performed quickly and securely. Wires in the 0.5 to 1.0 mm² cross-section range can be crimped or soldered by means of the spring action sensor stylus. The test adapters contact the screw head, cross connection or contact plate, depending on the model. The test adapter sets consist of a housing, spring, and sensor stylus. An end plate is supplied in addition with the **TAD** models. All test adapters can be marked by means of the quick identification system **PMC**.

Accessories Specific to the Screw Connection System

Testing / Examination

Test Plugs PS

The test plugs **PS 2.3** and **PS 4** allow a direct measurement at the contact rail of the respective screw connection terminals in the 2.5 mm² and 4 mm² cross-section range. As opposed to the test adapters **TA**, the test plugs **PS** do not click into place mechanically with the terminal. The adapter plug **ZS 2.3/4** allows the transition from a 4 mm.

Test Disconnection Terminals PTK

Test disconnection terminals are used primarily in the area of electricity generation and supply. They are tailored to the various prevailing switching requirements of the current transformer secondary circuit. When replacing measuring instruments, electricity meters and when making comparative measurements, current transformers must exhibit a closed secondary circuit.

CONTA-CLIP test disconnection terminals are available in the following three models

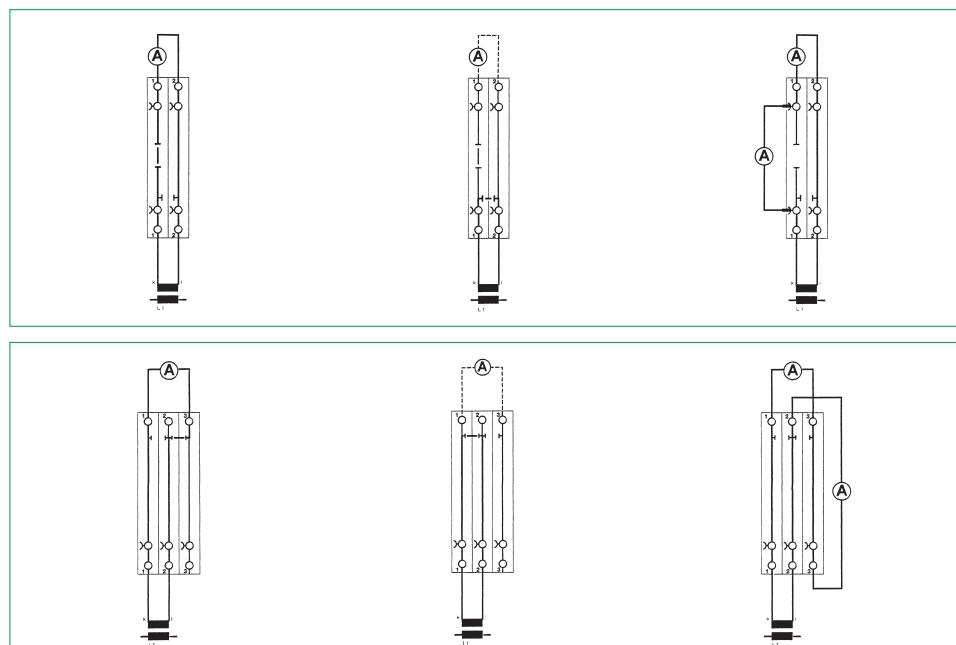

Socket connects can be attached to all models for a test pick-up using the test plug **PS 4**.

All models are contact safe in compliance with VBG 4. The current or voltage paths are disconnected by means of a permanent sliding disconnector. The switch position can be seen readily at all times, since the disconnection screw has a yellow insulation casing.

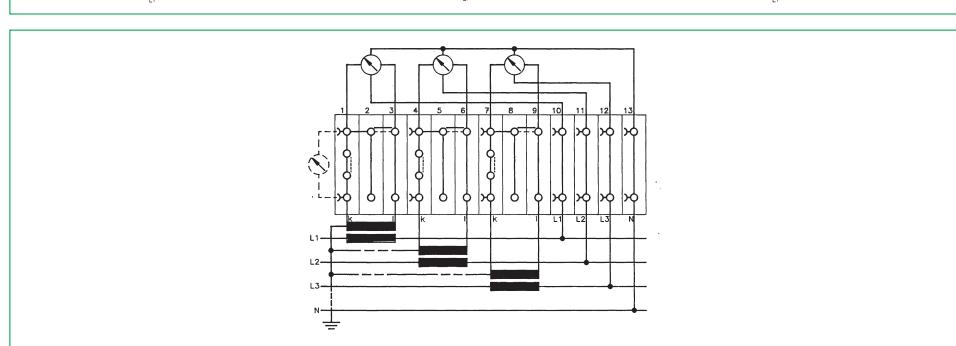

Necessary products for basic switching examples 1-3.

| Type | Cat. no. | Quantity |
|----------|---------------|----------|
| PTK/LT | 1130.2 | 1 |
| PTK/DU | 1134.2 | 1 |
| AP/L/Q/D | 2782.2 | 1 |
| STB 14/4 | 2050.0 | 2 |
| QVS 2 | 2197.0 | 1 |
| VH 19 | 2238.0 | 2 |
| STB 35 | 2244.0 | 2 |

Test Disconnection Terminals Accessories

Cross switches QVS

In order to attach the cross switch bridge **QVS**, connection sleeves **VH 19** and attachment screws **BS 25** or jacks **STB 35** are needed. The attachment screws and jacks are available with and without colour markings.

| Cross switches | QI | QSB | QVS | VH 19 |
|------------------------------|------------------|------------------|------------------|------------------|
| Type | | | | |
| Type | QI 2 | QSB 2 | QVS 2 | VH 19 |
| Cat. no./Qty. p. pck. | 2750.2/50 | 2783.0/20 | 2197.0/20 | 2238.0/50 |
| Type | QI 3 | QSB 3 | QVS 3 | |
| Cat. no./Qty. p. pck. | 2751.2/50 | 2784.0/20 | 2198.0/20 | |
| Type | QI 4 | QSB 4 | QVS 4 | |
| Cat. no./Qty. p. pck. | 2752.2/20 | 2785.0/20 | 2199.0/20 | |
| Type | QI 10 | | | |
| Cat. no./Qty. p. pck. | 2753.2/10 | | | |

Socket contacts STB 35

In the test disconnection terminals, the test plugs **PS 4** or the short circuit plugs **KSS 2-8** are inserted into the socket contacts **STB 35**. Socket contacts **STB 35** are also used when testing has to take place at the same time the **QVS** is used.

| Socket contacts | STB 35 | STB 14/4 | BS 25 | BS 25 |
|------------------------------|------------------|------------------|------------------|------------------|
| Type | | | | |
| Type | STB 35 yellow | STB 14/4 | BS 25 yellow | BS 25 |
| Cat. no./Qty. p. pck. | 2244.0/50 | 2050.0/50 | 2241.0/50 | 2240.0/50 |
| Type | STB 35 green | | BS 25 green | |
| Cat. no./Qty. p. pck. | 2245.0/50 | | 2242.0/50 | |
| Type | STB 35 violet | | BS 25 violet | |
| Cat. no./Qty. p. pck. | 2249.0/50 | | 2243.0/50 | |
| Type | | | | |
| Cat. no./Qty. p. pck. | | | | |

Test Plug PS 4

The test probe **PS 4** serves the final testing of wired test switches. A cross connection between the two PTK terminals can be established with the short circuit plug **KSS 2-8**.

| Test Plugs | PS 4 | KSS 2-8 | | |
|------------------------------|------------------|------------------|--|--|
